SUMMARY

Full-stack engineer specializing in **Python** backends and **Angular/React** front-ends, with **2+ years** shipping for a regulated financial platform at Bank of America. Delivered REST APIs, workflow-automation logic, and large-scale regulatory issue-management UIs, plus reporting automation that saved a 9-person team ~45 hours/week. Comfortable owning a feature end-to-end, from backend data models and APIs to the UI people use daily.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL

Backend & APIs: FastAPI, Flask, Django, Node.js, REST API Design, Microservices, Event-Driven Architecture

Frontend: React.js, Next.js, Angular, HTML5, CSS, Progressive Web Apps

Data & Analytics: MySQL, SQL Server, Power BI, DAX, Data Visualization, Apache Spark, Hadoop

Cloud & AI: AWS, Google Cloud, Machine Learning, LLMs, Text Embeddings, Retrieval-Augmented Generation (RAG)

Tools: Git, Jira, Unit Testing

WORK EXPERIENCE

Bank of America

Aug 2024 – Present

Software Engineer

Chennai, India

- Cut manual effort for issue batches by 56% across 5 task types, replacing per-issue handling with one-shot bulk runs.
- Extended a core registry framework to add **bulk actions** for regulatory issue management, letting users clear multiple issues in one batch action instead of one by one, shipped to the live platform with zero breaking changes.
- Delivered exception reassignment for the **PTE** board covering ~20 reassignments per week, replacing three fragmented move flows with one consistent user experience, now in regular use by internal teams.
- Automated reporting with **SQL and Python** for a 9-person team, saving approximately 45 hours per week in manual processing.
- Kept releases safe on the legacy platform: coverage from 87% to 94%, 6 flaky pipeline failures eliminated, zero breaking changes in production.
- De-risked the South Korea (**KRX**) reporting go-live, validating transactions with a 3-person team for a zero-error launch.
- De-risked **RBI-CCIL** filings with a Python pre-submission validation workflow used daily with zero reported errors.

Almoayyed Computers Middle East

Jun 2024 – Aug 2024

Data Analytics Intern

- Gave 10+ sales users self-serve visibility into performance and customer trends with 4 **Power BI dashboards**, delivered end-to-end from requirements gathering.
- Backed all 4 dashboards with reusable **SQL** extracts over 26 columns of sales and customer data, and answered 50+ ad-hoc business questions per week.

PROJECTS

PROFESSIONAL

Bulk Transition-Orchestration APIs Apr 2026 – Oct 2026
Python, Flask, REST APIs

- Built transition-orchestration logic in **Python/Flask**: a **dynamic task-to-transition map** routes each bulk job to the right transition across 5 task types, processing multiple issues per batch run.
- Extended the registry framework's action model with additive **bulk operations**, keeping the change backward compatible so the live system shipped with zero breaking changes.
- Verified transitions for all 5 task types across mixed-success and failure scenarios, with per-issue error reporting and regression tests on single-issue closure.

RBI-CCIL Transaction-Override Validation Jan 2025 – Mar 2026
Python

- Built a Python pre-submission **validation workflow** that checks transaction fields against business rules and reference data, flags invalid values, and creates an overriding transaction when the original is valid.
- Surfaced ACK/NACK status with rejection messages; on ACK the acknowledged event ID goes to a downstream team, on NACK the workflow stops for correction. Used daily in production with zero reported errors.

PTE Exception Reassignment Aug 2024 – Dec 2024
Python, Flask, Angular, REST APIs

- Collapsed the 3-step closure flow into a single UI action that performs the full sequence in one go.
- Built a Flask **ID-resolution API** fronted by an Angular integration: one reassignment contract serving move-selected, move-filtered, and move-all flows at ~20 reassignments per week.
- Tested valid, missing, and invalid IDs across all three flows with regression coverage; deployed with a zero-error release.

PERSONAL

SoundBridge Sep 2023 – Jan 2024
React.js, Next.js, TypeScript, Progressive Web App Demo

- Built an accessibility-first PWA delivering real-time alarm detection (30 ms) via the Web Audio API plus speech-to-text/text-to-speech via the Web Speech API for deaf and hard-of-hearing users, across 10 sound categories.

EDUCATION

Amrita Vishwa Vidyapeetham 2020 – 2024
BTech, Computer Science and Engineering Coimbatore, India

- CGPA: 7.04/10

CERTIFICATIONS

- **IBM:** Introduction to Big Data with Spark and Hadoop.
- **Google Cloud Computing Foundations:** Data, ML, and AI in Google Cloud (Credential ID: 6059269).
